

Make water with surplus solar.

Cyprus curtails solar generation while water production needs electricity.

Make drinking water during that window; store it for Paphos's later demand.

What we have

An operations workspace and a local experiment. A machine-learning radiation reference identifies sunny hours. Pick a day and tank size; inspect production, storage and forecast errors. Compare plans with 62 reported grid windows and record a review.

The sunny-hour flag is a proxy. Actual curtailed electricity absorbed remains unmeasured.

What we need

A water operator's demand, tank and plant limits, plus grid curtailment signals. Test whether extra daytime production can safely absorb otherwise lost electricity and reduce operating costs while maintaining water supply.

Grid serves water operators. Sites, a separate garden and leak demo, offers a smaller pilot route. Pricing still needs customer evidence.

Original concept and philosophy: Loucas Louka. Roadmap development: Stefanos. Technical work: Loucas and Stefanos. Business: Andreas Nikolaides and Cleopas Cleopa.

Codex assisted the implementation and drafts; the team must review them. Sources: Stefanos's 30 September roadmap and pitch; retained prototype results; EAC's July and August 2026 curtailment reports.
